

KPDBA-LAN

先导式溢流阀

工作 OPERATION

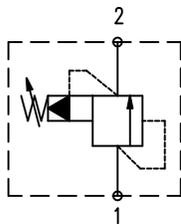

Direct-acting relief valves are normally closed pressure limiting valves that are commonly used to protect hydraulic components from transient pressure shocks. When the pressure at the inlet (port 1) reaches the valve's set value, the valve begins to overflow to the fuel tank (port 2), throttling to limit the pressure rise. This kind of valve has smooth adjustment, low noise, basically zero leakage, strong oil pollution resistance, anti-blocking and fast response speed.

直动式溢流阀为常闭压力限制阀，常用来保护液压元件，以防止其受瞬态压力的冲击。当压力在进口（口1）达到阀的设定值，阀开始向油箱（口2）溢流，节流以限制压力上升。此类阀调节平稳、噪声小，基本为零泄漏，抗油 污能力强，防堵塞并且响应速度快。

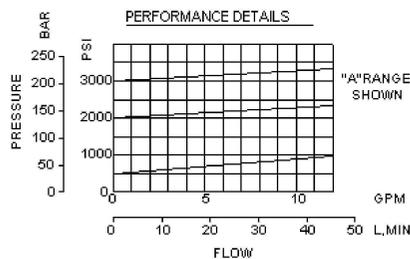

技术特性

- 可在口2接受最大压力；适合应用在交叉端口的溢流油路中。
- 调节螺杆的密封暴露在系统压力下。这意味着只有当压力被移除时，此阀才可被调节。设定流程为：检查设定，移除压力，调节阀，检查新设定。
- 此阀对变动的油液温度和油液污染不敏感。
- 选择溢流阀的弹簧范围时，为确保最大的可重复性，目标溢流设定值要接近最小和最大压力的中间范围。
- 油箱口（口2）处的背压直接以1:1的比例增加到阀的设定值上。
- 适合使用在负载锁紧应用中
